

Write your answers on the multiple choice grid on page 3

Sample: $2 + 4 =$ (A) 2 (B) 6 (C) 8 (D) 9

A ☐ B ☒ C ☐ D ☐

A B C D

A  B  C  D 

correct (arrow pointing to B)

- page 1 of 9

4. Which of the following is a use for manufactured esters?
- (A) fats
 - (B) food colouring
 - (C) detergents
 - (D) food flavouring**
5. The pH of 0.001 mol L⁻¹ solutions of Na₂O, CaO, SiO₂ and SO₂ are tested. Which would have the lowest pH?
- (A) CaO
 - (B) Na₂O
 - (C) SO₂**
 - (D) SiO₂
6. Several factors can disturb a system at equilibrium. Which of the following changes will always shift the equilibrium to the right?
- (A) change the concentration of the product(s)
 - (B) increase the concentration of one of the reactants
 - (C) cooling the equilibrium mixture
 - (D) changing the pressure of the reaction vessel

Section A. Multiple Choice Answer Grid

1.	A <input type="radio"/>	B <input checked="" type="radio"/>	C <input type="radio"/>	D <input type="radio"/>
2.	A <input type="radio"/>	B <input checked="" type="radio"/>	C <input type="radio"/>	D <input type="radio"/>
3.	A <input checked="" type="radio"/>	B <input type="radio"/>	C <input type="radio"/>	D <input type="radio"/>
4.	A <input type="radio"/>	B <input type="radio"/>	C <input type="radio"/>	D <input checked="" type="radio"/>
5.	A <input type="radio"/>	B <input type="radio"/>	C <input checked="" type="radio"/>	D <input type="radio"/>
6.	A <input type="radio"/>	B <input checked="" type="radio"/>	C <input type="radio"/>	D <input type="radio"/>

Section B: Short Answer Questions

MARKS

Question 7 (7 marks)

Acid rain is one of the major ecological problems in the world today and the main culprits are sulfur dioxide and nitrogen oxides from industrial processes.

- (a) Identify an industrial process which produces sulfur dioxide **or** nitrogen oxides and construct a chemical equation showing the formation of sulfur dioxide **or** an oxide of nitrogen.

2

Possible Answer:

Smelting of metal sulphide ores or combustion of fuels with sulfur impurities. (1 mark)

High temperature combustion of fuels. (1 mark)

- (b) Construct a chemical equation showing sulfur dioxide or an oxide of nitrogen forming acid rain.

1

Answer:

- (c) Identify two harmful aspects of acid rain.

2

- *leaching of nutrients from soil causing reduced fertility*
- *release of toxic metals (e.g. Al^{3+}) from minerals in the soil causing plant death*
- *corrosion of ferrous structures (e.g. bridges)*
- *deterioration of stonework and masonry*
- *reduced reproductive capacity & death of aquatic organisms in acidified lakes & rivers*
- *worsened attacks of bronchitis and asthma in city dwellers*

- (d) A large industrial plant produces 750,000 litres of sulfur dioxide per day.
The pollutant gas is neutralised with calcium hydroxide...

Calculate the mass of calcium hydroxide required to neutralise the sulfur dioxide at 100 kPa and 25°C.

2

Answer

$$\begin{aligned} \text{moles Ca}(\text{OH})_2 &= \text{moles SO}_2 = V \div \text{molar volume} = 750,000 \text{ L} \div 24.79 \text{ L mol}^{-1} \\ \text{moles Ca}(\text{OH})_2 &= 30,254 \text{ moles} \quad (1 \text{ mark}) \end{aligned}$$

$$\text{mass Ca}(\text{OH})_2 = n \times M = 30,254 \text{ mol} \times 74.096 \text{ g mol}^{-1} = 2.2417 \times 10^6 = 2.2 \times 10^6 \text{ g} \quad (1 \text{ mark})$$

Question 8 (4 marks)

Carbon dioxide dissolves in water according to the equilibrium...

The graph shows the solubility of carbon dioxide under changing conditions...

Question 8 continues next page (page 5)

Continuation of question 8

Identify the trends in the solubility of CO₂ and explain them based upon Le Châtelier's principle.

4

Outcome ~ H8

Answer:

The solubility of carbon dioxide is dependent upon temperature and pressure.

The graph shows the solubility increases with decreasing temperature. (1 mark)

The solvation reaction is exothermic, $\Delta H = -20.3 \text{ kJ mol}^{-1}$. Le Châtelier's principle states that a decrease in temperature would shift the equilibrium to favour the exothermic reaction.

(1 mark)

The graph shows the solubility increases with increasing pressure. (1 mark)

The solvation reaction causes a reduction in gas volume from 1 unit to 0.

Le Châtelier's principle states that an increase in gas pressure would shift the equilibrium to the side with the least gas volume. (1 mark)

Question 9 (4 marks)

Industrial chemistry processes have enabled scientists to develop replacements for natural products.

(a) Complete the table...

2

<i>Natural product (non-fossil fuel)</i>	<i>Replacement material</i>
<i>nitrates in soil OR phosphates in soil ► Others possible</i>	<i>nitrates derived from Haber process OR phosphates from super-phosphate ► Others possible</i>

(b) Discuss issues associated with shrinking world resources of the natural product you have identified.

2

Nitrates and phosphates are essential for soil fertility and plant growth. Soils become leached naturally and the export of crops depletes the producer soil. If nitrates and phosphates were not replenished, soils would become infertile, crop yields would fall and global famine would result.

► *Two valid points, e.g. cause and effect (2 marks)*

► *One valid point. (1 mark)*

Question 10(10 marks)

- (a) Use structural formulae to draw the reaction between 1-butanol and ethanoic acid.
Show the conditions necessary for reaction and name all organic products.

4**ANS**

Marking criteria	Marks
Correctly draws reactants and products, names product, indicates conditions	4
Three of the above	3
Two of the above	2
Correctly draws reactants or products or names product or describes conditions	1

- (b) Outline the advantages of using reflux to prepare an ester.

2

Marking criteria	Marks
Outlines two advantages of using reflux	2
Outlines one advantage of using reflux	1

Possible answer:

The reactants are volatile and yet need to be heated to reach their activation energy. Refluxing cools the reactant gases and condenses them returning them to the reaction mixture for continued heating. The gases would otherwise escape before they reacted.

(c) Explain trends in boiling points shown in the graph.

4

Marking Criteria	Marks
Provides a thorough explanation of the trends in boiling points BETWEEN AND WITHIN the three series of compounds	4
Provides a thorough explanation of the trends in boiling points BETWEEN each series OR Provides a sound explanation of the trends in boiling points BETWEEN the three series of compounds and identifies an aspect of the trends in boiling points WITHIN each series	2-3
Identifies the relationship between boiling points and intermolecular forces OR Identifies that boiling points increase as molecular weight increases OR Identifies the following trend in boiling points: Alkanoic acids > Alkanols > Alkanes OR Identifies hydrogen bonding as a strong intermolecular force	1

Possible answer:

The boiling point of alkanes, alkanols and alkanolic acids all increase with increasing molecular mass because the increasing mass is due to increasing carbon chain length. The longer the carbon chain the more dispersion forces exist between molecules and the more energy is needed to separate them.

As you go from alkanes to alkanols to alkanolic acid the functional group becomes more polar. Only weak dispersion forces need to be overcome to boil alkanes. However alkanols have these as well as dipole-dipole forces and hydrogen bonds due to hydroxyl functional group. Alkanolic acids have similar dispersion forces and similar hydrogen bonds due to the hydroxyl group but they are more polar molecules owing to the double-bonded oxygen as part of the carbonyl functional group. This gives more polarity to the molecule and results in stronger dipole-dipole forces. These require the most energy to overcome.

Question 11 .(4 marks)

Nuclear energy provides new elements. Some of these are transuranic elements

- (a) What are transuranic elements? **1**

Elements with atomic number greater than 92

- (b) Identify one example of a transuranic element and describe how it is produced. **2**

Americium (1 mark)

It is made by bombarding plutonium with neutrons (in a nuclear reactor) (1 mark)

- (c) Identify one method of detecting nuclear radiation. (1 mark)

Ans photographic film, cloud chamber, Geiger-Muller counter or scintillation counter (one only)

Question 12 (2 marks)

In each of the following reactions, which reactant is the acid? What is its conjugate base?
Complete the table below

2

Equation	Acid	Conjugate base
(a)	NH_4^+	NH_3
(b)	HCN	CN^-

Question 13 (7 marks)

The diagram below represents the number and type of chemical species (other than water molecules) present in a certain volume of an acidic solution, 'Acid HC'.

(a) Draw separate diagrams of Acid HA and Acid HB assuming all acids are in the same volume as above and represent the chemical species in a similar way to the diagram above.

(i) Acid HA is a weaker acid and more concentrated than Acid HC

2

Question 13 continues next page

Continuation of Question 13

(ii) Acid HB is stronger but the same concentration as Acid HC.

2

(b) Describe the difference between Acid HB and Acid HC in terms of an equilibrium between the intact molecules and its ions.

2

Ans

- i. 1 Mark for greater number of HA molecules
1 Mark for less ions
- (b) 1 Mark for more ions
1 Mark for same number of 'HB' species.
- (ii) $\text{HC}_{(\text{aq})} \leftrightarrow \text{H}^+_{(\text{aq})} + \text{C}^-_{(\text{aq})}$ (1 Mark)
- (iii) Equilibrium in HC lies more to the left in favour of the intact molecules whereas in HB equilibrium lies much more to the right in favour of the ions. (2 Marks)

End of Test
