

26a	At low temperature equilibrium yield is high, but it takes too long (weeks or months to reach equilibrium).	1
26b i	(At moderate temperature get reasonable yield in reasonable time.)	1
26b ii	iron (Fe), or magnetite (Fe ₃ O ₄) with its surface reduced to iron atoms	1
	The alternative pathway offered by the catalyst has a lower activation energy.	1
	Therefore the number of molecules at the low temperature which have sufficient energy to overcome this lowered energy barrier can be the same as the number of molecules at the high temperature with sufficient energy to overcome the higher energy barrier.	1
27a	$\text{FeSO}_4 \text{ reacted} = \text{FeSO}_4 \text{ originally} - \text{FeSO}_4 \text{ remaining to be neutralised by HCl}$ $= 0.15 \times 0.1 (\text{mark}) - (1 \text{ mark}) 0.23 \times 0.0231 (\text{mark}) = 0.0097 \text{ mol}$	3
27b	$n_{\text{Fe}} = n\text{NH}_4^+ = \text{FeSO}_4 \text{ reacted} = 0.0097 \text{ mol}$	1
27c	percent of N = $n \times \text{MM} (\text{mark}) \times 100 / m (\text{mark})$ $= 0.0097 \times 14 \times 10000 / 95 = 14.3\%$	2
28a	porous polypropylene, polysulfone or teflon	1
28b	cross section of a microscopic membrane filter 	1
28c	Dirty water under pressure is pushed against the membrane. The pores in the membrane are too small to allow microorganisms and other particulate matter through, but are large enough to allow the passage of water and small ions.	1
29a	The ozone layer in the stratosphere is needed to shield living organisms in the lower atmosphere from harmful ultraviolet radiation.	1
29b	Ozone, being a powerful oxidising agent, can cause harmful chemical changes in the cells of living organisms.	1
30a	concentration = $\frac{\text{absorbance of sample} \times \text{concentration of standard}}{\text{absorbance of standard}}$ $= \frac{0.078 \times 5.85}{1.087}$ $= 0.42 \text{ ppm}$	1
30b	$n_{\text{BaSO}_4} = \frac{m}{\text{MM}} = \frac{0.27233 \text{ g}}{233.34} = 1.157 \times 10^{-3}$	1
30b i	The number of moles of H ₂ SO ₄ = $2.05 \times 0.01 = 0.0205 \text{ mol}$, which would be enough to precipitate 0.0205 moles of BaSO ₄ . The reaction stopped before this, so all the Ba ²⁺ must have been used up, i.e. sulfuric acid was in excess.	1
30b ii	$n_{\text{Ba}^{2+}} = n_{\text{BaSO}_4} = 0.001157 \text{ mol}$	1
30b iii	$m_{\text{Ba}^{2+}} = n \times \text{MM} = 0.001157 \times 137.34 = 0.16 \text{ g L}^{-1}$	1

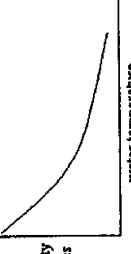

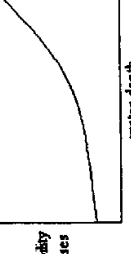

OPTION 1. INDUSTRIAL CHEMISTRY

1a	Wool – increasing population and increasing affluence → too much demand – alternative cheaper Rubber – increased number of vehicles → can't keep up with demand – limited supply Soap – increased population → increased demand – starting material (fat) used elsewhere (for food).	1
1b	Wool – acrylic, nylon Rubber – styrene-butadiene Soap – detergents	1
2	C	1
3a	concentration (mol L ⁻¹) initial [N ₂] [H ₂] [NH ₃] 0.19 0.38 0.23 change -0.04 +0.12 -0.08 at equilibrium 0.23 0.50 0.15	1
3b	$K = \frac{[\text{NH}_3]^2}{[\text{N}_2][\text{H}_2]^3}$	1
3c	$K = \frac{0.15^2}{0.23 \times 0.5^3} = 0.783$	1
4	is not soluble in water has low melting point has low density	1
5a	The energy used to remove an H ⁺ from an H ₂ SO ₄ molecule is much less than the energy released in forming a new bond between the H ⁺ and a water molecule.	1
5a ii	The heat released when a small volume of acid and water react is insufficient to suddenly vaporise a large volume of (acidified) water, but is sufficient to vaporise a small volume of water. (The boiling point of sulfuric acid is much higher, so it will not vaporise.)	1
5b	Wear eye protection, apron and gloves. Have some solid Na ₂ CO ₃ handy to neutralise any spills (and/or) Perform the dilution near a sink to quickly dilute any spill. Place water and stirring rod into a beaker Slowly pour a small quantity of the acid along the rod to avoid splashing. Stir. If the mixture becomes too hot allow it to cool before adding more acid.	1
6	B	1
7	Only the magnesium-lead cell is galvanic. The reaction is spontaneous (exothermic). The released energy can be in the form of electrical energy. (Chemical energy converted to electrical energy → galvanic cell.) In the copper-zinc cell the reaction will not proceed unless there is a constant supply of electrical energy. (Electrical energy converted to electrical energy → electrolytic cell)	1

8a	$2\text{Cl}^-_{(\text{aq})} + 2\text{H}_2\text{O}_{(\text{l})} \rightarrow \text{Cl}_{2(\text{g})} + \text{H}_{2(\text{g})} + 2\text{OH}^-_{(\text{aq})}$	1
8b	i. mercury contamination of the environment (waterways, lakes, oceans) ii. NaOH produced is contaminated by some NaCl. (or) The asbestos from which the diaphragm is made is a health hazard.	1
9		1
10a	$\rightarrow \text{NaHCO}_{3(\text{s})} + \text{NH}_4\text{Cl}_{(\text{aq})}$	1
10b	$n_{\text{CO}_2} = V/V_{\text{molar}} = 1000/24.45 = 40.9 \text{ mol}$ $n_{\text{NaHCO}_3} = n_{\text{CO}_2} = 40.9 \text{ mol}$ $m_{\text{NaHCO}_3} = n \times \text{MM} = 40.9 \times 106 = 65.4 \text{ g}$	1

OPTION 2. SHIPWRECKS AND SALVAGE

1a	Galvani	1
1b	Davy	1
1c	Faraday	1
2	The aluminium quickly forms aluminium oxide with air. This oxide layer is strongly bonded to the underlying aluminium, forming a protective layer preventing further oxidation.	1
3a	$0.34 - (-0.13) = 0.47 \text{ V}$	1
3b	i. at anode: iodine ii. at anode: oxygen	1
4	Container 11	1
5a		2
5b	Electrons are lost by both the steel and the sacrificial metal. As the electrons are removed from the steel, they are immediately replaced by electrons from the sacrificial metal. On metal tanks buried in moist ground.	1

5c	paint, grease, tin coating, enamelling, passivating the metal (OR) using applied voltage	1
5c	A barrier exists between the iron/steel and the oxidising material. (OR) The electron lost from the steel hull is immediately replaced by electrons from the power source.	1
6a	Bacteria that do not need oxygen	1
6b	They are sulfur reducing organisms, converting sulfates to sulfides, which facilitates the oxidation of iron. As well, their wastes reduce the pH of the water, which speeds up corrosion.	1
7a		1
7b		1
7c		1
8a	The removal of water causes salt to crystallise out. If the crystals form in the pores of porous objects the objects might crack, become distorted or react chemically with the object.	1
8b	i. $\text{Ag}_{2\text{S}} + \text{H}_2\text{S}_{(\text{aq})} \rightarrow \text{Ag}_{2\text{S}} + \text{H}_{2\text{S}}$ ii. $\text{Ag}_{2\text{S}} + 2\text{e}^- \rightarrow \text{Ag}_{2\text{S}} + \text{S}^{2-}_{(\text{aq})}$ iii. $\text{CaCO}_{3(\text{s})} + 2\text{H}^+_{(\text{aq})} \rightarrow \text{Ca}^{2+} + \text{CO}_{2(\text{g})} + \text{H}_2\text{O}_{(\text{l})}$	1
