

31 a. Possibilities are

1,5

2,5

3,5

4,5

5,1 5,2 5,3 5,4 5,5 5,6

6,5

∴ Probability of total of 8 = $\frac{2}{11}$

b. Let p = prob of supporting A = $\frac{3}{10}$

q = prob of supporting B = $\frac{7}{10}$

n = no. of A supporters

Then $P(X=r) = {}^nC_r \left(\frac{3}{10}\right)^r \left(\frac{7}{10}\right)^{n-r}$

$$\therefore P(X=4) = {}^7C_4 \left(\frac{3}{10}\right)^4 \left(\frac{7}{10}\right)^3$$

$$= 0.0972405$$

$$\approx 0.1$$

$$c. x = \frac{kx_2 + lx_1}{k+l}$$

$$y = \frac{kx_2 + lx_1}{k+l}$$

$$-1 = \frac{-3x_2 + 1x_2}{-3+1} \quad -4 = \frac{-3x_2 + 1x_2}{-3+1}$$

$$2 = -3x_2 + 3 \quad 8 = -3x_2 + 2$$

$$x_2 = \frac{1}{3} \quad y_2 = -2$$

$$\therefore B\left(\frac{1}{3}, -2\right)$$

d. $u = \cos x$

$$du = -\sin x \cdot dx$$

$$\text{if } x = \pi_2, u = 0$$

$$\text{if } x = \pi_3, u = \frac{1}{2}$$

$$\therefore I = \int_0^{\pi_3} -u^3 du$$

$$= \left[-\frac{u^4}{4} \right]_0^{\pi_3}$$

$$= -\frac{1}{4} - 0 = -\frac{1}{4}$$

$$e. \int_0^{\pi_4} \cos^2 \frac{1}{2} x \cdot dx$$

$$= \frac{1}{2} \int_0^{\pi_4} 1 + \cos x \cdot dx$$

$$= \frac{1}{2} [x + \sin x]_0^{\pi_4}$$

$$= \frac{1}{2} \left(\frac{\pi}{4} + \frac{1}{\sqrt{2}} \right)$$

(b)

$$(y=0)^2 = 4x^2 (x=0)$$

(c) Vertices (3,0)

(ii) S (4,0)

- offered as an assistance in constructing your own marking format
(individual teachers/schools find many other acceptable responses)

$$32 a. \frac{1}{x+1} \geq 1-x$$

Critical points at $x = -1$ and

$$\frac{1}{x+1} = 1-x$$

$$1 = 1-x^2$$

$$\Rightarrow x = 0$$

$$\frac{0}{-1} \quad \frac{0}{0}$$

Test $x = -2$ False

Test $x = -\frac{1}{2} \Rightarrow 2 \geq 1\frac{1}{2} \therefore$ True

$x = 1 \Rightarrow \frac{1}{2} \geq 0 \therefore$ True

Solution: $x > -1$

$$b. \int_0^{\pi_4} \frac{dx}{\sqrt{16-25x^2}}$$

$$= \int_0^{\pi_4} \frac{dx}{5\sqrt{\frac{16}{25} - x^2}}$$

$$= \frac{1}{5} \left[\sin^{-1} \frac{x}{\frac{4}{5}} \right]_0^{\pi_4}$$

$$= \frac{1}{5} \left[\sin^{-1} \frac{5x}{4} \right]_0^{\pi_4}$$

$$= \frac{1}{5} \left(\sin^{-1} \frac{1}{2} - \sin^{-1} 0 \right)$$

$$= \frac{1}{5} \cdot \frac{\pi}{6} = \frac{\pi}{30}$$

$$c. (i) M(a(p+q), a(\frac{p^2+q^2}{2}))$$

$$(ii) M_{pq} = \frac{p+q}{2} = k, a \text{ constant}$$

Then, for the point M,
 $x = a(p+q)$
 $= a \cdot 2k$
 $x = 2ak$

Since a and k are constant,
the locus of M is a line parallel to the y-axis

$$d. \angle U = \angle V \text{ (given)}$$

$$\angle UZX = \angle VZY \text{ (vertically opp)}$$

Now $\angle ZXW = \angle UZX + \angle U$ (exterior angle)

and $\angle ZYW = \angle VZY + \angle V$ (ditto)

$\therefore \angle ZXW = \angle ZYW$ (equal to sum of equal angles)

$$\therefore \Delta XZW \sim \Delta YZW$$

ZW is common

$$\angle ZXW = \angle ZYW \text{ (above)}$$

$$\angle XWZ = \angle YWZ \text{ (given ZW bisects } \angle YWX)$$

$$\therefore \Delta XZW \equiv \Delta YZW \text{ (AAS)}$$

$$\text{and } XW = YW$$

Q3. (a) $2 - \frac{3}{x+2} = \frac{2(x+2) - 3}{x+2}$

$= \frac{2x+1}{x+2}$

$\therefore \int \frac{2x+1}{x+2} dx$

$= \int_0^1 2 - \frac{3}{x+2} dx$

$= [2x - 3 \ln(x+2)]_0^1$

$= (2 - 3 \ln 3) - (0 - 3 \ln 2)$
 $= 2 + 3 \ln \left(\frac{2}{3}\right)$

(b) Let $\cos x - \sqrt{3} \sin x = A \cos(x+\theta)$
 $= A \cos x \cos \theta - A \sin x \sin \theta$

then $A \cos \theta = 1$

$A \sin \theta = \sqrt{3}$

$\Rightarrow \tan \theta = \sqrt{3}$ and $\theta = \frac{\pi}{3}$

and $A = 2$

$\therefore 2 \cos \left(x + \frac{\pi}{3}\right) + 1 = 0$

$\cos \left(x + \frac{\pi}{3}\right) = -\frac{1}{2}$

$x + \frac{\pi}{3} = \dots, \frac{4\pi}{3}, \frac{5\pi}{3}, \dots$

$x = \pi, \frac{4\pi}{3}$ in given domain

(c) (i) Let $f(x) = x \ln x - 1$

$f(1) = 1 \cdot \ln 1 - 1 < 0$

$f(2) = 2 \ln 2 - 1 > 0$

\therefore a solution exists between $x=1$ and $x=2$ (assuming $f(x)$ is continuous)

Q4 (a) $x^2 + y^2 - 6x + 2ky + 3k = 0$
 Completing the squares:
 $(x-3)^2 + (y+k)^2 = k^2 - 3k + 9$

If the centre $(3, -k)$ is on the line $x - 3y = 0$, then

$3 - 3(-k) = 0 \Rightarrow k = -1$

$\therefore C_1: (x-3)^2 + (y-1)^2 = 13$

If C_2 touches the x-axis, the radius is k

$\therefore \sqrt{k^2 - 3k + 9} = k$

$k^2 - 3k + 9 = k^2$

$\Rightarrow k = 3$

$\therefore C_2: (x-3)^2 + (y+3)^2 = 9$

(b) (i) $\frac{d}{dx} \left(\frac{1}{2} v^2 \right) = 2x^3 + 2x$

$\therefore \frac{1}{2} v^2 = \frac{1}{2} x^4 + x^2 + C$

If $v=2$, $x=1$

$\therefore \frac{1}{2} \cdot 2^2 = \frac{1}{2} \cdot 1 + 1 + C \Rightarrow C = \frac{1}{2}$

$\therefore \frac{1}{2} v^2 = \frac{1}{2} x^4 + x^2 + \frac{1}{2}$

$v^2 = x^4 + 2x^2 + 1$

$v = (x^2 + 1)^2$

(ii) So $v = \pm (x^2 + 1)$

but $v=2$ (>0), when $x=1$

$\therefore v = + (x^2 + 1)$

$\frac{dt}{dx} = \frac{1}{x^2 + 1}$

so $t = \tan^{-1} x + C$

New $x = \frac{1}{\sqrt{3}}$ when $t=0$

$\therefore C = -\tan^{-1} \frac{1}{\sqrt{3}} = -\frac{\pi}{6}$

so $t = \tan^{-1} x - \frac{\pi}{6}$

when $x=\sqrt{3}$, $t = \tan^{-1} \sqrt{3} - \frac{\pi}{6}$
 $= \frac{\pi}{3} - \frac{\pi}{6} = \frac{\pi}{6}$

(c) Let $S(n) = 5^{2n} - 1 = 6I$, where I is an integer.

$S(1): LHS = 5^2 - 1 = 24 = 6 \times 4$

$\therefore S(1)$ is true

Assume $S(k): 5^{2k} - 1 = 6I$ (I is an integer)

Consider $S(k+1):$

$LHS = 5^{2k+2} - 1$

$= 5^{2k} \cdot 5^2 - 1$

$= 25(5^{2k} - 1) - 1 + 25$

$= 25 \cdot 6I + 24$ by $S(k)$

$= 6[25I + 4]$

Now I is integer, $\therefore 25I + 4$ is int

Hence, if $S(k)$ is true, $S(k+1)$ is true

But $S(1)$ is true, so $S(2)$ is true

and then $S(3)$ is true and so

for all integer values of n .

$\therefore x = 500 \cot \theta$

$\frac{dx}{d\theta} = -500 \operatorname{cosec}^2 \theta$

(ii) $\frac{d\theta}{dt} = \frac{dx}{dt} \times \frac{dt}{dx}$

$= \frac{1}{-500 \operatorname{cosec}^2 \theta} \times 20$
 $= -\frac{1}{25} \sin^2 \theta$

(iii) At 9:01, $t=60$, $x=1200$
 Then $PD=1300$ (Pythagoras' Theorem)

$\therefore \sin \theta = \frac{500}{1300} = \frac{5}{13}$

$\therefore \frac{d\theta}{dt} = -\frac{1}{25} \times \left(\frac{5}{13}\right)^2$

$= -\frac{1}{169} \text{ degrees/sec.}$

(b) (i) $\ddot{x} = 0$ $\ddot{y} = -10$
 $\dot{x} = C_1$ $\dot{y} = -10t + C_2$

Initially $\dot{x} = 50 \operatorname{cosec} \theta$ $\therefore \dot{x} = 50 \operatorname{cosec} \theta$
 and $\dot{y} = 50 \sin \theta$ $\therefore \dot{y} = -10t + 50 \sin \theta$

$x = 50t \operatorname{cosec} \theta + C_3$ $y = -5t^2 + 50t \sin \theta + C_4$
 + since $x=0$ when $t=0$, and $y=0$ when $t=0$

$C_3 = 0$ $C_4 = 0$
 $\therefore x = 50t \operatorname{cosec} \theta$ $\therefore y = -5t^2 + 50t \sin \theta$

5

when $x=150$, $150 = 50t \operatorname{cosec} \theta$
 so $3 = t \operatorname{cosec} \theta$ --- (1)
 when $y=0$, $0 = -5t^2 + 50t \sin \theta$
 $= -5t(t - 10 \sin \theta)$

$\Rightarrow t = 10 \sin \theta$ (2)

Solving (1) & (2):

$3 = 10 \sin \theta \operatorname{cosec} \theta$
 $= 10 \sin^2 \theta$

$\therefore \sin 2\theta = \frac{3}{5}$
 $2\theta = 36^\circ 52'$, $143^\circ 08'$
 $\therefore \theta = 18^\circ 26'$ or $71^\circ 29'$

(ii) $\ddot{x} = 0$ $\ddot{y} = -10$
 $\dot{x} = C_1$ $\dot{y} = -10t + C_2$
 Initially, $\dot{x} = 55 \operatorname{cosec} \alpha$, $\dot{y} = 55 \sin \alpha$
 $\therefore \dot{x} = 55 \operatorname{cosec} \alpha$ $\dot{y} = -10t + 55 \sin \alpha$
 $\ddot{x} = 55$ $\ddot{y} = -10t$ success

Then $x = 55t + C_3$ $y = -5t^2 + C_4$
 when $t=0$, $x=0$ and $y=30$
 $\Rightarrow C_3 = 0$ $C_4 = 30$
 $\therefore x = 55t$ $y = -5t^2 + 30$

Now when $y=0$, $-5t^2 + 30 = 0$
 $\therefore t^2 = 6$
 $\therefore t = \sqrt{6}$

At $t = \sqrt{6}$, $x = 55\sqrt{6}$
 $\approx 135 \text{ m}$

\therefore group B cannot reach the target

86 (a) (i) $x = 2 \sin t - 3 \cos t$
 $\dot{x} = 2 \cos t + 3 \sin t$
 $\ddot{x} = -2 \sin t + 3 \cos t$
 $= -(2 \sin t + 3 \cos t)$
 $= -x$

\therefore motion is simple harmonic.

(ii) Amplitude $= \sqrt{2^2 + 3^2}$
 $= \sqrt{13} \text{ cm}$

(iii) $\dot{x} = 2 \cos t + 3 \sin t$
 $\ddot{x} = -2 \sin t + 3 \cos t$
 Max velocity when $\ddot{x} = 0$
 $-2 \sin t + 3 \cos t = 0$
 $3 \cos t = 2 \sin t$
 $\frac{3}{2} = \tan t$
 $t = 0.983, 4.1243 \dots \text{etc}$
 \therefore reaches maximum velocity
 when $t = 0.983$

(b) (i) $T = T_0 + k_2 vt$
 $\frac{dT}{dt} = k_2 \cdot A_2 vt$
 $\frac{dT}{dt} = k_2 (T - T_0)$

(ii) When $t=0$, $T = 95$, $T_0 = -10$
 $\Rightarrow A = 105$
 when $t=5$, $T = 65$
 $\therefore 65 = -10 + 105e^{5k}$

$e^{5k} = \frac{75}{105} = \frac{5}{7}$

$\ln e^{5k} = \ln \frac{5}{7}$

6

$\therefore k = \frac{1}{5} \ln \frac{5}{7}$

(iii) When $t=0$, $T_0 = 26$, $T = 65$
 $\therefore 65 = 26 + B e^{k \cdot 0}$
 $\therefore B = 39$

Therefore, at $t=5$, $5k$ with $k = \frac{1}{5}$
 $T = 26 + 39e^{5k}$

so $T = 53.86^\circ$
 $= 54^\circ$ (to the nearest deg)

Q7(a) $(3x - \frac{1}{x^2})^6 = \sum_{r=0}^6 {}^6C_r (3x)^{6-r} (-\frac{1}{x^2})^r$

Typical term, T_r , is

$$T_r = {}^6C_r 3^{6-r} x^{6-r} \cdot (-1)^r \cdot (x^{-2})^r$$

$$= {}^6C_r 3^{6-r} (-1)^r x^{6-3r}$$

Constant term when $6-3r=0$

$r=2$

Then $T_2 = {}^6C_2 3^4 (-1)^2$
 $= 1215$

(b)(i) $x^4 + x^2 - 1 = 0$

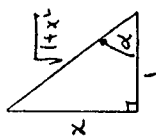

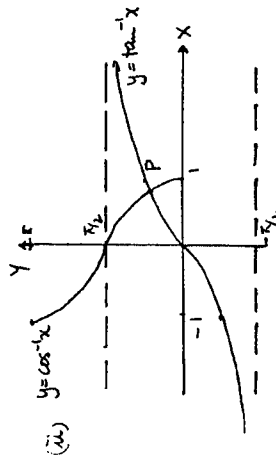

$$x^2 = \frac{-1 \pm \sqrt{1-4 \times 1 \times -1}}{2}$$

$$= \frac{-1 \pm \sqrt{5}}{2}$$

$\therefore x^2 = -\frac{1-\sqrt{5}}{2}$ or $-\frac{1+\sqrt{5}}{2}$

$x^2 = 0.618033988$

$x = \pm 0.786151377$
 $= \pm 0.79$

(iii) Let $\tan^{-1}x = \alpha$
 $\therefore x = \tan \alpha$

At P, $\cos^{-1}x = \tan^{-1}x = \alpha$

\therefore at P $\cos^{-1}x = \alpha$ and $x = \cos \alpha$

But $\cos \alpha = \frac{1}{\sqrt{1+x^2}}$ (from diagram)

$\therefore x = \frac{1}{\sqrt{1+x^2}}$

Squaring, $x^2 = \frac{1}{1+x^2}$

$+ x^4 + x^2 = 1$

$x^4 + x^2 - 1 = 0$

$\therefore x = 0.79$ (from (i))

and $y = \tan^{-1} 0.79 = 0.6686$

At Q, P(0.79, 0.67)

(iv) $A = \int_0^{0.67} \tan y \, dy + \int_{0.67}^{\pi/2} \cos y \, dy$
 $= [-\ln |\cos y|]_0^{0.67} + [\sin y]_{0.67}^{\pi/2}$

$= -\ln |\cos 0.67| + \sin \frac{\pi}{2} - \sin 0.67$

$= 0.62258$

$= 0.62$ (to 2-decimal places)
