

# 3 UNIT TRIAL HSC 2003.

## QUESTION 1

(a) (i)  $\sin 3x \times 1 + x \times 3 \cos 3x$   
 $\sin 3x + 3x \cos 3x$

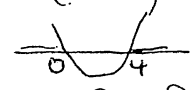

(ii)  $e^{1-x^2} \times -2x = -2xe^{1-x^2}$

(b)  $y = \frac{2}{3}x + \frac{8}{3}$       $y = 5x - 9$   
 $m_1 = \frac{2}{3}$       $m_2 = 5$   
 $\tan \theta = \left| \frac{\frac{2}{3} - 5}{1 + \frac{2}{3} \times 5} \right|$   
 $\theta = 45^\circ$

(c) (i)  $\left[ \frac{1}{2} \tan^{-1} \frac{x}{2} \right]_0^2$   
 $\frac{1}{2} \left[ \frac{\pi}{4} - 0 \right] = \frac{\pi}{8}$

(ii)  $\frac{1}{3} \int_0^1 \frac{3x^2}{x^3+2}$   
 $= \frac{1}{3} \left[ \log(x^3+2) \right]_0^1$   
 $= \frac{1}{3} (\log 3 - \log 2)$   
 $\approx 0.135$  or  $\frac{1}{3} \log \frac{3}{2}$

(d)  $\frac{5!}{8!} \quad \frac{1}{336}$

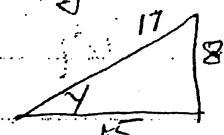

(e)  $\theta < 0$  or  $\theta > 4$   
 $1 - \frac{4}{\theta} > 0$  or  $\frac{\theta^2 - 4\theta}{\theta} > 0$   
 $1 > \frac{4}{\theta}$   
 $\theta < 0$  or  $\theta > 4$   
 $\theta^2 - 4\theta > 0$   
 $\theta(\theta - 4) > 0$   
  
 $\theta < 0$  or  $\theta > 4$

## QUESTION 2

(a) (i)  $\alpha + \beta + \gamma = -\frac{b}{a} = \frac{5}{2}$   
 $\alpha\beta\gamma = -\frac{1}{2}$

(ii)  $(\alpha + \beta + \gamma)^2 - 2(\alpha\beta + \alpha\gamma + \beta\gamma)$   
 $\frac{25}{4} - 2 \times \frac{-3}{2} = 9\frac{1}{4}$

(b)  $\int_0^{2\sqrt{3}} \frac{x}{\sqrt{u}} \times \frac{du}{2x}$       $u = x^2 + 4$   
 $\frac{1}{2} \int_0^{2\sqrt{3}} u^{-\frac{1}{2}} du$       $\frac{du}{dx} = 2x$   
 $= \frac{1}{2} \left[ \frac{u^{\frac{1}{2}}}{\frac{1}{2}} \right]_4^{16}$       $dx = \frac{du}{2x}$   
 $= \left[ \sqrt{4} - 2 \right] = 2$

(c)  $y = \tan^{-1} \frac{8}{15}$   
 $\tan y = \frac{8}{15}$   

$\cos y = \frac{15}{17}$

(d) (i)  $A\left(\frac{1}{3}, 2\pi\right)$       $C\left(-\frac{1}{3}, 0\right)$

(ii)  $y = \pi + 2 \sin^{-1} 3x$   
 $\frac{dy}{dx} = 2 \times \frac{3}{\sqrt{1-9x^2}}$

$x = 0$  grad of tangent =  $\frac{6}{\sqrt{1-0}}$   
 $= 6$

### QUESTION 3

(a)  $y = f(x) \quad y = 1 + e^{2x}$   
 $f^{-1}(x) \quad x = 1 + e^{2y}$   
 $e^{2y} = x - 1$   
 $2y = \log(x - 1)$   
 $y = \frac{1}{2} \log(x - 1)$

Domain  $x > 1$  Range All real  $y$

(b) Rational roots when  $\Delta = b^2 - 4ac = 0$  or has rational square root

$$36 - 4(5k - 4)(6k + 3) = 0$$

$$36 - 120k^2 + 36k + 48 = 0$$

$$-120k^2 + 36k + 84 = 0$$

$$10k^2 - 3k - 7 = 0$$

$$(10k + 7)(k - 1) = 0$$

rational roots when  $k = -\frac{7}{10}$  or  $1$

multiple solutions when  $-120k^2 + 36k + 84$  has rational roots

(c) (i)  $\angle ABG = \angle BEG$  (angle in alternate segment)

$\angle BEG = \angle CEH$  (vertically opposite)

$\angle CEH = \angle DCH$  (angle in alternate segment)

$\therefore \angle ABG = \angle DCH$  as required

(ii)  $\angle CBH = \angle BGC$  (alternate segment)

$\angle BCE = \angle CHE$  "

$\therefore \angle GBC = \angle HCB$  (angle sum of  $\Delta$ )

$\therefore \triangle BCG \cong \triangle BCH$  (equiangular)

(d) (i)  $a = 2^N \quad r = 2^{-1}$

$$S_n = \frac{a}{1-r}$$

$T_n \quad ar^{n-1} = 2^{-N}$

$$2^N (2^{-1})^{n-1} = 2^{-N}$$

$$2^{-n+1} = 2^{-2N}$$

$$-n+1 = -2N$$

$$n = 2N+1$$

2

$$= \frac{2^N}{1 - \frac{1}{2}}$$

$$= 2 \cdot 2^N = 2^{N+1}$$

1

4) (a)  $\sin 2\theta = 2 \sin \theta \cos \theta$   
 (i)  $\sin \theta = 2 \sin \frac{\theta}{2} \cos \frac{\theta}{2}$

$$\cos 2\theta = \frac{\cos^2 \theta - \sin^2 \theta}{1 - 2 \sin^2 \theta}$$

$$2 \cos^2 \theta - 1$$

$$\text{so } \cos \theta = \frac{\cos^2 \frac{\theta}{2} - \sin^2 \frac{\theta}{2}}{1 - 2 \sin^2 \frac{\theta}{2}}$$

$$2 \cos^2 \frac{\theta}{2} - 1$$

$$f(\theta) = \frac{2 \sin \frac{\theta}{2} \cos \frac{\theta}{2} + \sin \frac{\theta}{2}}{1 + 2 \cos^2 \frac{\theta}{2} - 1 + \cos \frac{\theta}{2}}$$

$$= \frac{\sin \frac{\theta}{2} [2 \cos \frac{\theta}{2} + 1]}{\cos \frac{\theta}{2} [2 \cos \frac{\theta}{2} + 1]}$$

$$= \tan \frac{\theta}{2} = t$$

(3)

(ii)  $f(\theta) = \tan \frac{\theta}{2} = 1$  general soln.

$\therefore$  If  $\tan \theta = a$ , then  $\theta = n\pi + \tan^{-1}(a)$

$\tan \frac{\theta}{2} = 1$ , then  $\frac{\theta}{2} = n\pi + \frac{\pi}{4}$   
 $\theta = 2n\pi + \frac{\pi}{2}$

(1)  $n$  an integer

2003 SU Unit 7K12 1 nar  
 Section B

12

$$4 \text{ (b) (i) } t = 2x^2 - 5x + 3$$

$$\frac{dt}{dx} = 4x - 5$$

$$\frac{dx}{dt} = v = \frac{1}{4x-5} \quad (1)$$

$$\begin{aligned} \text{(ii) using } a &= \frac{d}{dx} \left( \frac{1}{2} v^2 \right) \\ &= \frac{d}{dx} \left( \frac{1}{2(4x-5)^2} \right) \\ &= \frac{d}{dx} \left[ \frac{1}{2} (4x-5)^{-2} \right] \\ &= -(4x-5)^{-3} \times 4 \\ &= \frac{-4}{(4x-5)^3} \quad (2) \end{aligned}$$

$$\text{(iii) (a) when } x=2, \quad v = \frac{1}{3} \text{ cm/s} \quad \left(\frac{1}{2}\right) \\ a = -\frac{4}{27} \text{ cm/s}^2 \quad \left(\frac{1}{2}\right)$$

$$\begin{aligned} \text{(b) when } t=6, \quad 6 &= 2x^2 - 5x + 3 \\ (2x+1)(x-3) &= 0 \\ x &= -\frac{1}{2}, x=3 \quad (1) \end{aligned}$$

$$\begin{aligned} \text{take } x &= 3 \\ \text{At } x=3, \quad v &= \frac{1}{7} \text{ cm/s} \quad \left(\frac{1}{2}\right) \\ a &= \frac{4}{343} \quad \left(\frac{1}{2}\right) \end{aligned}$$

(iv) particle is travelling to the right but is slowing down. (2)

$$(5) \quad (a) \quad (i) \quad \frac{\cos y - \cos(y+2\alpha)}{2\sin\alpha} = \sin(y+\alpha).$$

$$\text{LHS} \quad \frac{\cos y - (\cos y \cos 2\alpha - \sin y \sin 2\alpha)}{2\sin\alpha}$$

$$\frac{\cos y - (\cos y (1-2\sin^2\alpha) - \sin y 2\sin\alpha \cos\alpha)}{2\sin\alpha}$$

$$\frac{\cancel{\cos y} - \cancel{\cos y} + \cancel{2\sin^2\alpha} \cos y + \cancel{2\sin\alpha} \cos\alpha \sin y}{2\sin\alpha}$$

$$= \sin\alpha \cos y + \cos\alpha \sin y$$

$$= \sin(y+\alpha)$$

(2)

$$(ii) \quad \sin\alpha + \sin 3\alpha + \sin 5\alpha + \dots + \sin(2n-1)\alpha = \frac{1 - \cos 2n\alpha}{2\sin\alpha}$$

step 1 Prove true for  $n=1$

$$\text{LHS} = \sin\alpha$$

$$\text{RHS} = \frac{1 - \cos 2\alpha}{2\sin\alpha} = \frac{1 - (1 - 2\sin^2\alpha)}{2\sin\alpha} = \sin\alpha = \text{LHS}.$$

true for  $n=1$ .

step 2 Assume true for  $n=k$  (a positive integer) so

$$\sin\alpha + \sin 3\alpha + \sin 5\alpha + \dots + \sin(2k-1)\alpha = \frac{1 - \cos 2k\alpha}{2\sin\alpha}$$

and we must prove it true for  $n=k+1$ , so

$$\sin\alpha + \sin 3\alpha + \sin 5\alpha + \dots + \sin(2k-1)\alpha + \sin(2k+1)\alpha = \frac{1 - \cos 2(k+1)\alpha}{2\sin\alpha}$$

$$\text{LHS} \quad \frac{1 - \cos 2k\alpha}{2\sin\alpha} + \sin(2k+1)\alpha$$

=

$$\frac{1 - \cos 2k\alpha}{2\sin\alpha} + \sin(2k\alpha + \alpha).$$

now using (a)(i)  $\sin(y + \alpha) = \frac{\cos y - \cos(y + 2\alpha)}{2\sin\alpha}$

then  $\sin(2k\alpha + \alpha) = \frac{\cos 2k\alpha - \cos(2k\alpha + 2\alpha)}{2\sin\alpha}$

now,  $\frac{1 - \cos 2k\alpha}{2\sin\alpha} + \frac{\cos 2k\alpha - \cos 2(k+1)\alpha}{2\sin\alpha}$

$$= \frac{1 - \cos 2(k+1)\alpha}{2\sin\alpha}$$

$\therefore$  RHS.

True for  $n = k+1$ .

step 3 If the statement is true for  $n=k$ , then it is also true for  $n=k+1$ . Since the statement is true for  $n=1$ , it follows that it must also be true for  $n=2$  and so on.  $\therefore$  the statement is true for all positive integers  $n$ .

(4)

(5) (b) (i)  $y = \frac{x^3+4}{x^2} = \frac{x^3}{x^2} + \frac{4}{x^2} = x + 4x^{-2} = x + \frac{4}{x^2}$

$$y' = 1 - 8x^{-3} = 1 - \frac{8}{x^3}$$

$$y'' = 24x^{-4} = \frac{24}{x^4}$$

Stat points exist when  $y' = 0$ ,  $1 - \frac{8}{x^3} = 0$

$$\frac{8}{x^3} = 1 \Rightarrow x^3 = 8 \Rightarrow x = 2$$

At  $x=2$ ,  $y = 2 + \frac{4}{2^2} = 3$   $(2, 3)$  (1) (min stat pt)  $y'' > 0$

Inflexions occur when  $y'' = 0$  and  $\exists$  a sign change  
 $\frac{24}{x^4} = 0 \Rightarrow 24 = 0x^4$  does not exist. (1)

(ii)  $y = \frac{x^3+4}{x^2} \Rightarrow x \neq 0$  (y axis) (1/2) vertical asymptote

$y = \frac{x^3(1 + \frac{4}{x^3})}{x^2} = x(1 + \frac{4}{x^3})$  and as  $x \rightarrow \infty$   $y \approx x$ . (1/2) oblique asymptote

(iv)

when  $y=0$ ,  
 $0 = \frac{x^3+4}{x^2}$

so  $x^3+4=0$   
 $x^3 = -4$   
 $x = \sqrt[3]{-4}$

$$5 \text{ (b) (iv)} \quad x^3 - kx^2 + 4 = 0$$

$$x^3 + 4 = kx^2$$

$$\text{So} \quad \frac{x^3 + 4}{x^2} = k$$

$$\Rightarrow y = \frac{x^3 + 4}{x^2} = k$$

3 intersections will occur between  $y = k$  and  $y = \frac{x^3 + 4}{x^2}$  if  
 $k > 3$ .

(2)

# Question (7). [12]

(a)  $P(x) = (x+4)u(x) + 5$   
 $= (x-1)u(x) + 9.$

[3]

$\therefore P(-4) = 5, \quad P(1) = 9. \quad \text{--- (1)}$

$P(x) = (x-1)(x+4)q(x) + (ax+b).$

From (1)  $\begin{cases} -4a+b=5 \\ a+b=9 \end{cases} \quad \text{--- (2)}$

$\therefore 5a=4 \Rightarrow a=4/5$

$\therefore b=9-4/5=41/5$

i.e.  $\boxed{\frac{4x}{5} + \frac{41}{5}}$

(b) To find the range, set  $y=0.$

(i) i.e.  $x(\tan\theta - \frac{gx}{2V^2\cos^2\theta}) = 0.$

i.e.  $x=0$ , or  $x = \frac{2V^2\cos^2\theta \times \tan\theta}{g}$

i.e. range =  $\frac{V^2(2\sin\theta\cos\theta)}{g}$

$= \frac{V^2\sin 2\theta}{g}$  [2]

$\therefore$  Maximum range occurs when  $\sin 2\theta = 1 \Rightarrow R = \frac{V^2}{g}$

(b)

(ii)

(1) Equation of higher trajectory ( $T_2$ ) is  $R = R \tan\theta - \frac{gR^2}{2V^2\cos^2\theta}$  (velocity)

When the speed of projectile was  $V$ , the range was:

$R = \frac{V^2\sin 2\theta}{g}$  --- (2)

Substitute (2) into (1) we have.

$R = \frac{V^2\sin 2\theta}{g} = \frac{V^4\sin^2 2\theta}{gV^2\cos^2\theta}$

Note:  $\sin 2\theta = 2\sin\theta\cos\theta, \quad \tan\theta = \sin\theta/\cos\theta$

$\therefore R = \frac{2V^2\sin^2\theta}{g} = \frac{2V^4\sin^2\theta}{gV^2}$

When  $v=V$ , Range is  $R_{\max} \therefore \theta=45^\circ$

$\therefore R = \frac{V^2}{g} = \frac{V^4}{gV^2}$  [4]

$\therefore V^2gR = V^2V^2 = V^4, \quad U^2(V^2-gR) =$

$\therefore U^2 = \frac{V^4}{V^2-gR}$

$\therefore U = \frac{V^2}{\sqrt{V^2-gR}}$

Question  
7(c)

$\therefore AD$  bisects  $\angle BAC (=90^\circ)$   
 $\therefore \angle BAD = \angle DAC = 45^\circ$

$\Rightarrow \angle HDA = \angle KDA = 45^\circ$   
 (Angle sum of a  $\Delta$ ).

i.e.  $\triangle AHD$  is isos.  $\Rightarrow AH = DH$ .

In  $\triangle AHD$ ,  $AD^2 = AH^2 + DH^2$

(Pythagoras)  $= 2DH^2$

$$\therefore \left( \frac{AD}{DH} \right)^2 = 2$$

$$\Rightarrow \frac{AD}{DH} = \sqrt{2} \quad [1]$$

$$\boxed{\frac{1}{DH} = \frac{\sqrt{2}}{AD}} \quad \text{--- (1)}$$

(ii)  $\triangle AHD \equiv \triangle AKD$  (AAS).

$$\therefore DH = DK. \quad \text{--- (2)}$$

$$\begin{aligned} \text{Area of } \triangle ABC &= \frac{1}{2} AB \cdot AC. \end{aligned}$$

$$\begin{aligned} \text{but area of } \triangle ABC &= \text{area of } \triangle ABD \\ &+ \text{area of } \triangle ACD. \end{aligned}$$

$$\begin{aligned} \text{Area of } \triangle ABD &= \frac{1}{2} AB \cdot DH \\ \text{Area of } \triangle ACD &= \frac{1}{2} AC \cdot DK. \end{aligned}$$

$$\text{from (2)} \quad \therefore DK = DH$$

$$\therefore \text{Area of } \triangle ACD = \frac{1}{2} AC \cdot DH.$$

$$\therefore \frac{1}{2} AB \cdot AC = \frac{1}{2} (AB \cdot DH + AC \cdot DH)$$

$$\therefore DH (AB + AC) = AB \cdot AC. \quad [2]$$

$$\therefore \frac{AB + AC}{AB \cdot AC} = \frac{1}{DH}$$

$$\boxed{\frac{1}{AC} + \frac{1}{AB} = \frac{\sqrt{2}}{AD}} \quad \text{from (1)}$$

## Solution — Section C

### Question (b) [12]

$$x = 2t, y = t^2 \quad \therefore y = \frac{x^2}{4}$$

$$\text{Solve: } \begin{cases} y = \frac{x^2}{4} \\ y = mx + c \end{cases}$$

$$\therefore x^2 - 4mx - 4c = 0 \quad \text{--- (1)}$$

The roots to (1) are:  $2p, 2q$ .

$$\therefore \sum x_i : 2p + 2q = 4m$$

$$\text{i.e. } p + q = 2m \quad \text{--- (2)}$$

Product of roots:  $4pq = -4c$

$$(i) \quad \therefore pq = -c \quad \text{--- (3)} \quad [2]$$

$$(ii) \quad \text{Now, } p^2 + q^2 = (p+q)^2 - 2pq \\ = 4m^2 - 2(-c)$$

$$p^2 + q^2 = 4m^2 + 2c \quad [2]$$

$$(iii) \quad \text{gradient of } tqt. = p$$

$$\therefore \text{gradient of normal} = -\frac{1}{p}$$

$$\therefore \text{equation of normal: } y - p^2 = -\frac{1}{p}(x - 2p)$$

(iv) The equation of normal at Q is

$$x + qy = q^3 + 2q \quad \text{--- (5)}$$

$\therefore$  (4) - (5) we have:

$$(p - q)y = (p^3 - q^3) + 2(p - q)$$

$$\therefore y = 2 + p^2 + pq + q^2 \quad \text{--- (6)}$$

Substitute (6) into (4) we have:

$$x + 2p + p^3 + p^2q + pq^2 = p^3 + 2p$$

$$\therefore x = -p^2q - pq^2 = -pq(p + q)$$

$$\therefore N(-pq(p + q), (2 + p^2 + pq + q^2)) \quad [2]$$

(8)

## Question (6)

(V)

$$\boxed{pq = -c, \quad p+q = 2m, \\ p^2 + q^2 = 4m^2 + 2c.}$$

The x-coord. of N becomes  $c(2m)$   
The y-coord. of N becomes

$$\{ 2 + (4m^2 + 2c) - c \}$$

$$\boxed{N = (2mc, 4m^2 + c + 2)}$$

(x) Chord PQ, whose equation is

$$y = mx + c, \text{ is free to move}$$

Whilst maintaining a fixed grad.

i.e.  $mpq = m$  (a constant), but

$c$  is a variable.

$$\text{Now } x = 2mc, \Rightarrow c = \frac{x}{2m}$$

$$y = 2 + 4m^2 + \frac{x}{2m} \quad [2]$$

$$\boxed{y = \frac{x}{2m} + 2(1 + 2m^2)}$$

i.e. Equation of locus of N  
is a straight line with gradient  
 $\frac{1}{2m}$  and y-intercept  $2(1 + m^2)$ .

The points of intersection of the  
locus of N and  $x^2 = 4y$  are found  
by solving

$$\begin{cases} y = \frac{x}{2m} + 2(1 + 2m^2) \\ x = 2t, \quad y = t^2 \end{cases}$$

$$\text{i.e. } t^2 = \frac{x}{2m} + 2(1 + 2m^2).$$

$$mt^2 - t - 2m(1 + 2m^2) = 0.$$

(4)

$$\therefore t = \frac{1 \pm \sqrt{1 + 8m^2(1 + 2m^2)}}{2m}$$

$$= \frac{1 \pm (1 + 4m^2)}{2m}$$

$$\therefore t = \frac{1 + 2m^2}{m}, \quad \text{or } t = -2m$$

$\therefore$  locus of N cut parabola in 2pt  
say U, V with parameters

$$t = \begin{cases} \frac{1 + 2m^2}{m} \\ -2m \end{cases}$$

[2]

From gradient of  $tg t$ , ( $=t$ )  $\Rightarrow$   
the gradients of  $tg t$  at U, V are  
 $\frac{1 + 2m^2}{m}$  and  $-2m$ . In particular,  
the  $tg$  at V has gradient  $-2m$   
while the locus of N has  
gradient  $\frac{1}{2m}$ . Hence the locus of  
N is normal at V  $\Rightarrow$  normal at
