Marker's Comments

(a) $8ay = x^2 - 4ax - 20a^2$

(i) $x^2 - 4ax + 4a^2 = 8ay + 20a^2 + 4a^2$
 $(x - 2a)^2 = 8a(y + 3a)$

Vertex is $(2a, -3a)$.

2

(ii) $A = 2a$

Directrix: $y = -5a$

$(2a, -3a)$

1

(b) $x^2 = 8y$ i.e. $y = \frac{x^2}{8}$

(i) $\frac{dy}{dx} = \frac{2x}{8} = \frac{x}{4}$ at $(4p, 2p^2)$

Tangent at P: $y - 2p^2 = p(x - 4p)$

$y - 2p^2 = px - 4p^2$

$px - y - 2p^2 = 0$

2

(ii) Tangent at P: $px - y = 2p^2$ (1)

Tangent at Q: $qx - y = 2q^2$ (2)

(1) - (2) $(p - q)x = 2p^2 - 2q^2$
 $= 2(p - q)(p + q)$

$x = 2(p + q)$

Subst. into (1): $y = p \times 2(p + q) - 2p^2$
 $= 2p^2 + 2pq - 2p^2$

T is $[2(p + q), 2pq]$

3

(iii) x -coord of M = $\frac{4p + 4q}{2} = 2(p + q)$

Since T, M have the same x -coord, then TM \parallel y -axis (axis of parabola)

1

$\angle ADB = 90^\circ$ (angle in a semi-circle)
 $\therefore \angle BDC = 90^\circ$

$\therefore \angle DBE = 90^\circ - \theta$ (angle sum of $\triangle BDC$)

$\therefore \angle BDE = 90^\circ - \theta$ (base angles of isos. $\triangle BDE$)

since $EB = ED$ (tangents from external point are equal)

$\therefore \angle BED = 180^\circ - 2(90^\circ - \theta)$ (angle sum of $\triangle BDE$)
 $= 2\theta$

3

Many students didn't handle the algebra well or were confused with working with the 'a'.

i) well done

ii) didn't have to derive tangent at Q. a number of students couldn't solve the simultaneous eqns or didn't see that $2p^2 - 2q^2 = 2(p + q)(p - q)$.

iii) many students found gradient of TM and showed that it was undefined \therefore TM is a vertical line. Correct but more working than given explanation.

c) well done by those that worked through it.

Marker's Comments

(b). $P(x) = x^3 + 4x^2 + ax + b$

(i) $P(1) = 0: 1 + 4 + a + b = 0 \therefore a + b = -5$ (1)

$P(-2) = 0: -8 + 16 - 2a + b = 0 \therefore -2a + b = -8$ (2)

(1) - (2): $3a = 3 \therefore a = 1, b = -6$ (2)

(ii) $(x-1)(x+2)(x+c) \equiv x^3 + 4x^2 + ax + b$

$\therefore -2c = -6 \therefore c = 3$

Third factor is $(x+3)$

OR Use "sum of roots"

(c) $P(x) = x^3 - 5x + 3$

(i) $P(1) = -1; P(2) = 1$

$P(1.5) = 1.5^3 - 5 \times 1.5 + 3 = -1.125$

\therefore Root lies between 1.5 and 2

(ii) $x_2 = x_1 - \frac{P(x_1)}{P'(x_1)}$

$= 1.5 - \frac{-1.125}{1.75}$

$= 1.75$

$= 2.14$ (2dp)

(d) Prove $5^n + 2 \times 11^n$ is a multiple of 3

When $n=1, 5^1 + 2 \times 11^1 = 5 + 2 \times 11 = 27 = 3 \times 9$

\therefore it is true for $n=1$

Assume it is true for $n=k$.

i.e. assume $5^k + 2 \times 11^k = 3M$ (M integer)

When $n=k+1, 5^{k+1} + 2 \times 11^{k+1} = 5 \times 5^k + 2 \times 11 \times 11^k$

$= 5 \times 5^k + 2 \times 11 \times 11^k$

$= 5(5^k - 2 \times 11^k) + 22 \times 11^k$

by assumption

$= 15M - 10 \times 11^k + 22 \times 11^k$

$= 15M + 12 \times 11^k$

$= 3(5M + 4 \times 11^k)$

\therefore if it is true for $n=k$, then it is true for $n=k+1$.

Since it is true for $n=1$, it is true for all positive integers n .

Correctly well done

Well done.

Well done

For mark needed to show $P(1.5) < 0$ $P(2) > 0$
 \therefore lies between 1.5 and 2.

Well done.

Properly answered.

1 Mark for proving true for $n=1$

1 Mark for assuming

$5^k + 2 \times 11^k = 3M$ and substitution into T_{k+1} .

1 Mark for showing

T_{k+1} is a multiple of 3

1 Mark for conclusion.

Those that could not prove it true for $n=k+1$ were only awarded 1 Mark
