MATHEMATICS Extension 1 : Question 3

Suggested Solutions

Marks

Marker's Comments

Q3(a) $\tan(2\cos^{-1}\frac{12}{13})$

Let $\theta = \cos^{-1}\frac{12}{13} \Rightarrow \cos\theta = \frac{12}{13}$

$$\tan 2\theta = \frac{2\tan\theta}{1-\tan^2\theta} = \frac{2 \times \frac{5}{12}}{1-\frac{25}{169}} = \frac{2 \times 5 \times 12}{169-25} = \frac{120}{144} = \frac{5}{6}$$

[2]

$$\frac{1}{2} \text{ For } \cos\theta = \frac{12}{13}$$

$$\frac{1}{2} \text{ For } \tan\theta = \frac{5}{12}$$

$$1 \text{ For } \frac{2 \times \frac{5}{12}}{1-\frac{25}{169}}$$

$$\text{or } \frac{120}{144}$$

(b) (i) $x^2 = 8y$
 $\therefore y = \frac{x^2}{8}$ PC(4p, 2p²)

①

$$\frac{dy}{dx} = \frac{2x}{8} = \frac{x}{4}$$

Gradient of tangent at P: $m_T = \frac{4p}{4} = p$

Equ. of tangent at P: $y - 2p^2 = p(x - 4p)$

$$y - 2p^2 = px - 4p^2$$
$$\therefore y = px - 2p^2$$

(ii) $C = (0, -2p^2)$

For Q $(0, -2p^2)$ i.e. P(4p, 2p²)

$$Q = \left(\frac{4p+0}{4}, \frac{2p^2-6p^2}{4}\right) = (p, -p^2)$$

③

Let Q(x, y) be the general point on the required locus

$$\therefore x = p \quad \text{--- (1)}$$

$$y = -p^2 \quad \text{--- (2)}$$

$$y \Rightarrow p = x \text{ in (2)} \quad y = -(x)^2$$

$$\therefore \text{locus of Q } x^2 = -y$$

(c) $v = x^3 - x$

$$\ddot{x} = v \frac{dv}{dx} = \frac{d}{dx} \left(\frac{1}{2} v^2 \right)$$

$$\ddot{x} = (x^3 - x)(3x^2 - 1)$$

[2]

(d) For two 1s 1 N° of ways = $3 \times 9B = 216$

For not having two 1s N° of ways = $9 \times 3 \times 8 = 216$

or $4C_2 \times 1 \times 9 \times 8 = 432$ TOTAL 432

[2]

(e) $I = \int \cos^2 \frac{x}{2} dx = \frac{1}{2} \int (1 + \cos x) dx$
$$= \frac{1}{2} [x + \sin x] + C$$

[2]

1 For $\cos^2 A = \frac{1}{2}(1 + \cos 2A)$
or equiv.

MATHEMATICS Extension 1 : Question 4

Suggested Solutions

Marks

Marker's Comments

Q4(a) $(2x^2 - \frac{3}{x})^9$

[2]

General term $T_{r+1} = {}^9C_r (2x^2)^{9-r} \times \left(-\frac{3}{x}\right)^r = Ax^0$

$$\therefore {}^9C_r 2^{9-r} (-3)^r x^{18-2r-r} = Ax^0$$
$$\Rightarrow 18-3r = 0$$
$$r = 6$$

$$\therefore \text{Term is the seventh } T_7 = {}^9C_6 2^3 3^3 = 126 \times 8 \times 27 = 27216$$

(b)

- $\angle DCE = \alpha$ (Angles in same segment standing on arc DE are equal)
- $\angle DAB = \alpha$ (Exterior angle of cyclic quad ABCD equals interior opposite angle)
- As $\angle DFE = \angle DAB = \alpha$
 \therefore AGED is a cyclic quad and
(Exterior angle equals interior opposite angle [converse])

(c) (i)

$$N^{\circ} \text{ of ways} = 1000 + 3000 + 5000$$

$$= {}^6C_1 \times {}^5C_5 + {}^6C_2 \times {}^5C_3 + {}^6C_5 \times {}^5C_1$$

$$= 6 + 20 \times 10 + 6 \times 5$$

$$= 236$$

[2]

Note: $0+0=E$
 $E+E=E$
Need odd no. of odd nos.
for sum to be odd

(ii)

$$P(E) = \frac{236}{462} = \frac{118}{231}$$

[1]

(d) Let $P = 2000$, Int. rate = 0.08, n is ...
 $R = 1.08$ $M = 200$

(i) After 1st prize:

$$B_1 = P \times R - 200$$

After 2nd prize awarded:

$$B_2 = B_1 R - 200 = (PR - 200)R - 200$$
$$= PR^2 - 200(1 + R)$$

After 3rd:

$$B_3 = B_2 R - 200 = (PR^2 - 200(1 + R))R - 200$$
$$= PR^3 - 200(1 + R + R^2)$$

$$\therefore \text{After } n^{\text{th}}: B_n = PR^n - 200(1 + R + R^2 + \dots + R^{n-1})$$

$$= PR^n - 200 \left(\frac{R^n - 1}{R - 1} \right)$$

$$= 2000R^n - \frac{200(R^n - 1)}{0.08}$$

$$= 2000R^n - 2500(R^n - 1)$$

$$= -500R^n + 2500 = 500[5 - 1.08^n] \text{ red.}$$

[4]

Set $B_n = 0$
 $\Rightarrow 1.08^n = 5$
 $\Rightarrow n = \frac{\log 5}{\log 1.08} = 20.912$
 \therefore No. of years is 21

5.

Marker's Comments

$$\begin{aligned}
 Q6(b)(i) \quad f_2(x) &= 1 + \frac{x}{1!} + \frac{x(x+1)}{2!} \\
 &= \frac{2 + 2x + x(x+1)}{2} = \frac{2 + 2x + x^2 + x}{2} \\
 &= \frac{x^2 + 3x + 2}{2} \quad \checkmark \\
 &= \frac{1}{2}(x+1)(x+2) \quad (2)
 \end{aligned}$$

and the zeros are -1 and -2

1 For getting to $\frac{x^2 + 3x + 2}{2}$ (ii) Let $P(n)$ be the proposition that:

$$f_n(x) = 1 + \frac{x}{1!} + \frac{x(x+1)}{2!} + \dots + \frac{x(x+1)(x+2)\dots(x+n-1)}{n!} = \frac{1}{n!}(x+1)(x+2)\dots(x+n)$$

• Now $P(1)$ was given $P(2)$ was shown true in part (i)* Assume $P(n)$ is true for some integer k .

$$\text{i.e. } f_k(x) = 1 + \frac{x}{1!} + \frac{x(x+1)}{2!} + \dots + \frac{x(x+1)\dots(x+k-1)}{k!} = \frac{1}{k!}(x+1)(x+2)\dots(x+k) \quad (*)$$

RTP: $P(k+1)$ is true

$$\text{i.e. } f_{k+1}(x) = \frac{1}{(k+1)!}(x+1)(x+2)\dots(x+k+1)$$

PROOF: For $P(k+1)$

$$f_{k+1}(x) = 1 + \frac{x}{1!} + \frac{x(x+1)}{2!} + \dots + \frac{x(x+1)\dots(x+k-1)}{k!} + \frac{x(x+1)(x+2)\dots(x+k)}{(k+1)!}$$

$$= \frac{1}{k!}(x+1)(x+2)\dots(x+k) + \frac{x(x+1)\dots(x+k-1)(x+k)}{(k+1)!} \quad \text{using assumption } (*)$$

$$= \frac{(x+1)(x+2)\dots(x+k)}{k!} \left\{ 1 + \frac{x}{k+1} \right\}$$

$$= \frac{1}{k!}(x+1)(x+2)\dots(x+k) \left\{ \frac{k+1+x}{k+1} \right\}$$

$$= \frac{1}{(k+1)!}(x+1)(x+2)\dots(x+k+1) \quad (3)$$

∴ $P(k+1)$ is true* ∴ by the PMI $P(n)$ is true for $n=1, 2, 3, \dots$

Marker's Comments

$$\begin{aligned}
 (a) \quad V &= \pi \int_{r-w}^r (r^2 - x^2) dx \quad (2) \\
 &= \pi \left[r^2 x - \frac{1}{3} x^3 \right]_{r-w}^r \\
 &= \pi \left[\left(r^3 - \frac{1}{3} r^3 \right) - \left(r^2(r-w) - \frac{1}{3}(r-w)^3 \right) \right] \\
 &= \pi \left[\frac{2}{3} r^3 - \frac{(r-w)(3r^2 - (r-w)^2)}{3} \right] \\
 &= \frac{\pi}{3} \left[2r^3 - (r-w)(3r^2 - r^2 + 2rw - w^2) \right] \\
 &= \frac{\pi}{3} \left[2r^3 - (r-w)(2r^2 + 2rw - w^2) \right] \\
 &= \frac{\pi}{3} \left[2r^3 - (2r^3 + 2r^2 w - rw^2 - 2rw^2 - w^3) \right] \\
 &= \frac{\pi}{3} \left[3rw^2 - w^3 \right] = \frac{\pi}{3} (3r-w)w^2
 \end{aligned}$$

(b)

(i) As $\triangle OPA \parallel \triangle CMA$ (equiangular)

$$\frac{r}{R} = \frac{OA}{AC} \quad (\text{corresponding sides in similar } \triangle s \text{ are in the same ratio})$$

$$\begin{aligned}
 \frac{r}{R} &= \frac{H+(r-h)}{L} \\
 rL &= HR + rR - hR \\
 r(L-R) &= (H-h)R \quad \checkmark
 \end{aligned}$$

$$\therefore r = \frac{(H-h)R}{L-R} \quad (2)$$

(ii) using (a) where $h=w$, $r = \frac{(H-h)R}{L-R}$

$$\begin{aligned}
 \therefore V &= \frac{\pi}{3} \left(3 \frac{(H-h)R}{L-R} h^2 - h^3 \right) \\
 &= \frac{\pi}{3(L-R)} \left[3HR - 3hr - hL + hR \right] h^2 \quad (1) \\
 &= \frac{\pi}{3(L-R)} \left[3RHh^2 - (L+2R)h^3 \right]
 \end{aligned}$$

$$\begin{aligned}
 (iii) \quad \frac{dV}{dh} &= \frac{\pi}{3(L-R)} \left[6RHh - 3(L+2R)h^2 \right] \\
 &= \frac{\pi}{L-R} \left[2RHh - (L+2R)h^2 \right]
 \end{aligned}$$

For possible max/min values of V to occur $\frac{dV}{dh} = 0$

$$\therefore h(2RH - (L+2R)h) = 0$$

$$(4) \quad \therefore h=0 \text{ or } h = \frac{2RH}{L+2R}$$

$$\text{TEST: } \frac{d^2V}{dh^2} = \frac{\pi}{L-R} \left[2RH - 2(L+2R)h \right]$$

$$\begin{aligned}
 \text{at } h = \frac{2RH}{L+2R} \quad \frac{d^2V}{dh^2} &= \frac{\pi}{L-R} \left[2RH - 4RH \right] = -\frac{2RH}{L-R} < 0 \text{ as } L > R \\
 \therefore \text{a relative max T.P. at } h &= \frac{2RH}{L+2R} \quad r = \frac{RHL}{(L-R)(L+2R)}
 \end{aligned}$$
